Regularity structures for singular SPDEs

Joint work with M. Hoshino & S. Kusuoka

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

1 What is singular?

► **Theorem** – *The product map*

$$(a,b) \in C^{\alpha} \times C^{\beta} \mapsto ab \in C^{\alpha \wedge \beta}$$

is well-defined and continuous iff $\alpha + \beta > 0$.

1 What is singular?

► Theorem – The product map

$$(a,b) \in C^{\alpha} \times C^{\beta} \mapsto ab \in C^{\alpha \wedge \beta}$$

is well-defined and continuous iff $\alpha + \beta > 0$.

- Heat equation with white noise potential

$$(\partial_t - \Delta)u = \zeta u,$$

for a space white noise $\zeta = \zeta(x)$ on a 2-dimensional torus: ζ is $(-1)^-$ regular.

– The 2-dimensional Φ^4 equation

$$(\partial_t - \Delta)u = \xi - u^3,$$

for a spacetime white noise $\xi = \xi(t, x)$ on 2-dimensional space torus that is $(-2)^{-}$ (parabolic) regular.

- The 1-dimensional (gKPZ) equation

$$(\partial_t - \partial_x^2)u = f(u)\xi + g(u)(\partial_x u)^2,$$

for a spacetime white noise $\xi = \xi(t, x)$ on 1-dimensional space torus that is $(-3/2)^{-}$ (parabolic) regular.

2 The mantra of singular SPDEs

Adopt a langage in which we disentangle the task of solving the PDE from the task of making sense of some ill-defined products.

Mantra – For a given equation, if one can make sense of the a priori ill-defined products when u is replaced by some reference random objects then one can make sense of these products when u "looks like" the reference objects.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

2 The mantra of singular SPDEs

Adopt a langage in which we disentangle the task of solving the PDE from the task of making sense of some ill-defined products.

Mantra – For a given equation, if one can make sense of the a priori ill-defined products when u is replaced by some reference random objects then one can make sense of these products when u "looks like" the reference objects.

What "*looks like*" means leads either to regularity structures or paracontrolled calculus.

 ${\bf Gain}-{\sf Making}$ sense of some functionals of the noise is not a PDE problem, it is a probability problem!

For a given (admissible) model, this equation on modelled distributions turns out to have a unique solution \mathbf{u}^{M} in small time.

Reformulate the PDE as an integral equation

$$\mathcal{L}u = \mathcal{F}(u, \nabla u)\xi \iff u \simeq \mathcal{L}^{-1}(\mathcal{F}(u, \nabla u)\xi).$$

• Fix an (admissible) model M. Lift the operator \mathcal{L}^{-1} into an M-dependent operator \mathcal{K}^M on some spaces of modelled distributions (= local expansions) such that

$$\mathcal{L}^{-1} \circ R^{M} = R^{M} \circ K^{M}.$$

• Reformulate the integral equation as an equation in a space of modelled distributions

 $\mathbf{u}\simeq K^{M}(F(\mathbf{u},D\mathbf{u})\Xi).$

For a given (admissible) model, this equation on modelled distributions turns out to have a unique solution \mathbf{u}^{M} in small time.

Is $u = R^{M}(\mathbf{u}^{M})$ the solution of an equation?

• When ξ continuous and $M(\xi)$ is the natural/canonical model associated to ξ then $u := R^{M(\xi)}(\mathbf{u}^{M(\xi)})$ solution of

 $\mathcal{L}u = \mathcal{F}(u, \nabla u)\xi.$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

• When ξ continuous and $M(\xi)$ is the natural/canonical model associated to ξ then $u := R^{M(\xi)}(\mathbf{u}^{M(\xi)})$ solution of

 $\mathcal{L}u = \mathcal{F}(u, \nabla u)\xi.$

• When ξ has low regularity the natural model does not make sense: *Product* problems in its formal definition and $M(\xi^{\epsilon})$ diverges.

If M^{ϵ} converges then $u^{M^{\epsilon}}$ and u^{ϵ} converge.

$$\partial_t u - a(u)\partial_x^2 u = f(u)\Xi + g(u)(\partial_x u)^2$$
(1)

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

$$\partial_t u - a(u)\partial_x^2 u = f(u)\Xi + g(u)(\partial_x u)^2$$
(1)

▶ Theorem (Local in time well-posedness) – Take $u_0 \in C^{0^+}(\mathbf{T})$ and a function $\mathbf{a} \in C_b^3$ with values in a compact subset of $(0, \infty)$. In the full subcritical regime, one can construct a regularity structure, containing infinitely many trees $\tau^{\mathbf{p}}$ of any fixed degree, within which, for any admissible model, the quasilinear equation (1) is well-posed locally in time.

Here τ runs over the finitely many trees of the BHZ regularity structure of the semilinear (gKPZ) equation and **p** is an integer-valued decoration on the edges of τ .

$$\partial_t u - a(u)\partial_x^2 u = f(u)\Xi + g(u)(\partial_x u)^2$$
(1)

► Theorem (Local in time well-posedness) – Take $u_0 \in C^{0^+}(\mathbf{T})$ and a function $\mathbf{a} \in C_b^3$ with values in a compact subset of $(0, \infty)$. In the full subcritical regime, one can construct a regularity structure, containing infinitely many trees $\tau^{\mathbf{p}}$ of any fixed degree, within which, for any admissible model, the quasilinear equation (1) is well-posed locally in time.

– Denote by $\ell^{\lambda,\epsilon}(au)$ the BPHZ counterterms of the equation

$$\partial_t u - \lambda \partial_x^2 u = f(u)\xi^{\epsilon} + g(u)(\partial_x u)^2$$

built from the regularized noise ξ^{ϵ} .

$$\partial_t u - a(u)\partial_x^2 u = f(u)\Xi + g(u)(\partial_x u)^2$$
(1)

► Theorem (Local in time well-posedness) – Take $u_0 \in C^{0^+}(\mathbf{T})$ and a function $\mathbf{a} \in C_b^3$ with values in a compact subset of $(0, \infty)$. In the full subcritical regime, one can construct a regularity structure, containing infinitely many trees $\tau^{\mathbf{p}}$ of any fixed degree, within which, for any admissible model, the quasilinear equation (1) is well-posed locally in time.

– Denote by $\ell^{\lambda,\epsilon}(au)$ the BPHZ counterterms of the equation

$$\partial_t u - \lambda \partial_x^2 u = f(u)\xi^{\epsilon} + g(u)(\partial_x u)^2$$

built from the regularized noise ξ^{ϵ} .

► Theorem (Renormalized equation) – There is an explicit polynomial function $\chi_{\mathfrak{a}}(\tau)$ of \mathfrak{a} and its derivatives such that the solution u^{ϵ} to $\partial_{t}u^{\epsilon} - \mathfrak{a}(u^{\epsilon})\partial_{x}^{2}u^{\epsilon} = f(u^{\epsilon})\xi^{\epsilon} + g(u^{\epsilon})(\partial_{x}u^{\epsilon})^{2} + \sum_{\tau} \frac{\ell^{\mathfrak{a}(u^{\epsilon}(\cdot)),\epsilon}(\tau)}{S(\tau)}\chi_{\mathfrak{a}}(\tau)(u^{\epsilon})\mathcal{F}(\tau)(u^{\epsilon}),$ with initial condition $u_{0} \in C^{0^{+}}(\mathbf{T})$, converges (in law) on a random time interval, as $\epsilon \downarrow 0$.

Local in time well-posedness

• Modelled distributions built with *series instead of finite sums*: Needed in Picard iteration

$$u \simeq \mathbf{K}^{\mathbf{M}} \Big(F(u)\zeta + G(u)(Du)^2 + \big(A(u) - 1\big)\mathbf{D}^2 u \Big).$$

Local in time well-posedness

• Modelled distributions built with *series instead of finite sums*: Needed in Picard iteration

$$u \simeq \mathbf{K}^{\mathbf{M}} \Big(F(u)\zeta + G(u)(Du)^2 + \big(A(u) - 1\big)\mathbf{D}^2 u \Big).$$

• In a semilinear setting small factor for *contraction* comes from the gain in time explosion at initial time in multilevel *Schauder estimates* for K^M .

Local in time well-posedness

• Modelled distributions built with *series instead of finite sums*: Needed in Picard iteration

$$u \simeq \mathbf{K}^{\mathbf{M}} \Big(F(u)\zeta + G(u)(Du)^2 + (A(u)-1)\mathbf{D}^2 u \Big).$$

- In a semilinear setting small factor for *contraction* comes from the gain in time explosion at initial time in multilevel *Schauder estimates* for K^M.
- Here the map $\Phi: u \mapsto K^M((A(u) 1)D^2u)$ is not contracting but it has a decomposition

$$\Phi = \Phi_1 + \Phi_2$$

where Φ_2 is a contraction for a small enough time horizon and an *iterate* of Φ_1 is a contraction. (Details are being written.)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

Renormalized equation – From the automated approach, for the *BHZ model* M^{ϵ} built from a regularized noise ξ^{ϵ} , and $u^{M^{\epsilon}}$ the solution to the RS (QgKPZ) equation with model M^{ϵ} , the function $u^{\epsilon} = \mathcal{R}^{M^{\epsilon}}(u^{M^{\epsilon}})$ is a solution to the renormalized equation

$$\partial u^{\epsilon} - \mathsf{a}(u^{\epsilon})\partial_{x}^{2}u^{\epsilon} = f(u^{\epsilon})\xi^{\epsilon} + g(u^{\epsilon})(\partial_{x}u^{\epsilon})^{2} + \sum_{\tau^{\mathbf{p}}} \frac{\ell^{1,\epsilon}(\tau^{\mathbf{p}})}{S(\tau^{\mathbf{p}})} \mathcal{F}^{\mathbf{a}}(\tau^{\mathbf{p}})(u^{\epsilon},\partial_{x}u^{\epsilon}).$$

The solution of the coherence relation has here a particular structure

$$\mathcal{F}^{\mathsf{a}}\big(\tau^{\mathsf{p}}\big)\big(\mathsf{c_0},\mathsf{c_0}'\big) = \chi_{\mathsf{a}}(\tau)(\mathsf{c_0})\left(\mathsf{a}(\mathsf{c_0}) - 1\right)^{|\mathsf{p}|} \mathcal{F}(\tau)(\mathsf{c_0})$$

for some functions $\chi_a(\tau)$ and $\mathcal{F}(\tau)$ defined inductively, with $\chi_a(\tau)$ a polynomial function of *a* and its derivatives.

Lemma – For any τ with null **p**-decoration the function

 $\lambda \mapsto \ell^{\lambda,\epsilon}(\tau)$

is analytic in any given bounded interval $(a, b) \subset (0, +\infty)$ with a > 0 and

$$\frac{1}{n!} \partial_{\lambda}^{n} \ell^{\lambda,\epsilon}(\tau) = \sum_{\mathbf{p} \in \mathbb{N}^{E_{\tau}}, \, |\mathbf{p}|=n} \ell^{\lambda,\epsilon}(\tau^{\mathbf{p}}).$$

▲□▶▲圖▶▲≧▶▲≧▶ ≧ のへぐ

Then one has

$$\sum_{\tau^{\mathbf{p}}} \frac{\ell^{1,\epsilon}(\tau^{\mathbf{p}})}{S(\tau^{\mathbf{p}})} \, \chi_{\mathbf{a}}(\tau)(\mathbf{c_0}) \left(\mathbf{a}(\mathbf{c_0}) - 1 \right)^{|\mathbf{p}|} \mathcal{F}(\tau)(\mathbf{c_0})$$

Then one has

$$\begin{split} \sum_{\tau^{\mathbf{p}}} \frac{\ell^{1,\epsilon}(\tau^{\mathbf{p}})}{S(\tau^{\mathbf{p}})} \,\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \left(\mathbf{a}(\mathbf{c_{0}})-1\right)^{|\mathbf{p}|} \mathcal{F}(\tau)(\mathbf{c_{0}}) \\ &= \sum_{\tau} \frac{\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \,\mathcal{F}(\tau)(\mathbf{c_{0}})}{S(\tau)} \sum_{\mathbf{p} \in \mathbb{N}^{E_{\tau}}} \ell^{1,\epsilon}(\tau^{\mathbf{p}}) \left(\mathbf{a}(\mathbf{c_{0}})-1\right)^{|\mathbf{p}|} \end{split}$$

Then one has

$$\begin{split} \sum_{\tau^{\mathbf{p}}} \frac{\ell^{1,\epsilon}(\tau^{\mathbf{p}})}{S(\tau^{\mathbf{p}})} \,\chi_{\mathfrak{a}}(\tau)(\mathsf{c}_{0}) \left(\mathfrak{a}(\mathsf{c}_{0})-1\right)^{|\mathbf{p}|} \mathcal{F}(\tau)(\mathsf{c}_{0}) \\ &= \sum_{\tau} \frac{\chi_{\mathfrak{a}}(\tau)(\mathsf{c}_{0}) \,\mathcal{F}(\tau)(\mathsf{c}_{0})}{S(\tau)} \sum_{\mathbf{p} \in \mathbb{N}^{E_{\tau}}} \ell^{1,\epsilon}(\tau^{\mathbf{p}}) \left(\mathfrak{a}(\mathsf{c}_{0})-1\right)^{|\mathbf{p}|} \\ &= \sum_{\tau} \frac{\chi_{\mathfrak{a}}(\tau)(\mathsf{c}_{0}) \,\mathcal{F}(\tau)(\mathsf{c}_{0})}{S(\tau)} \sum_{n=0}^{\infty} \left(\mathfrak{a}(\mathsf{c}_{0})-1\right)^{n} \sum_{|\mathbf{p}|=n} \ell^{1,\epsilon}(\tau^{\mathbf{p}}) \end{split}$$

Then one has

$$\begin{split} \sum_{\tau^{\mathbf{p}}} \frac{\ell^{1,\epsilon}(\tau^{\mathbf{p}})}{S(\tau^{\mathbf{p}})} \,\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \left(\mathbf{a}(\mathbf{c_{0}})-1\right)^{|\mathbf{p}|} \mathcal{F}(\tau)(\mathbf{c_{0}}) \\ &= \sum_{\tau} \frac{\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \,\mathcal{F}(\tau)(\mathbf{c_{0}})}{S(\tau)} \sum_{\mathbf{p} \in \mathbb{N}^{E_{\tau}}} \ell^{1,\epsilon}(\tau^{\mathbf{p}}) \left(\mathbf{a}(\mathbf{c_{0}})-1\right)^{|\mathbf{p}|} \\ &= \sum_{\tau} \frac{\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \,\mathcal{F}(\tau)(\mathbf{c_{0}})}{S(\tau)} \sum_{n=0}^{\infty} \left(\mathbf{a}(\mathbf{c_{0}})-1\right)^{n} \sum_{|\mathbf{p}|=n} \ell^{1,\epsilon}(\tau^{\mathbf{p}}) \\ &\stackrel{\text{Lemma}}{=} \sum_{\tau} \frac{\chi_{\mathbf{a}}(\tau)(\mathbf{c_{0}}) \,\mathcal{F}(\tau)(\mathbf{c_{0}})}{S(\tau)} \,\ell^{\mathbf{a}(\mathbf{c_{0}}),\epsilon}(\tau). \end{split}$$

ご清聴ありがとうございました

Thank you for your attention!
