

# Matrices filled by Variables, from Posets to Coxeter Groups, and Beyond

*jeudi 21 novembre 2024 10:00 (50 minutes)*

Last year at CAP2023 I gave a talk about a class of matrices filled by variables, whose eigenvalues are linear forms in the variables. The construction was based on finite posets. I'll speak about a generalization to convex sets in general reflection groups, and even to the case where there is no group at all.
