

## A small projective resolution of complex K-theory

*mercredi 12 octobre 2016 11:40 (50 minutes)*

Around 1982 Nick Kuhn proved that the symmetric powers of the sphere spectrum give rise to a minimal projective resolution of  $H\mathbb{Z}$ . He then asked if there were other interesting examples of small projective resolutions of spectra, in particular of spectra like  $bo$  or  $bu$ . In this talk I will show how to construct a small projective resolution of the connective K-theory spectrum  $bu$ . Our resolution has many similarities to the classic one that arises from the symmetric powers filtration. We give a unified proof of exactness of both resolutions, that is different from Kuhn's proof. A key ingredient in our proof is a vanishing result for the Bredon homology of the complex of partitions and the complex of direct-sum decompositions. Joint work with Kathryn Lesh.
