

An Introduction to Matrix Parametrized Proximal Splitting

lundi 28 juillet 2025 17:30 (30 minutes)

In this talk we introduce the Matrix Parametrized Proximal Splitting, a proximal splitting method which generalizes a number of splitting methods introduced in the recent literature. Our formulation is capable of constructing convergent splitting algorithms for arbitrary communication constraints imposed between the proximal operators. We review central aspects of the method, state requirements for convergence, and then discuss computational performance.
