## **Zheng LIU. $p$ -adic families of Klingen-Eisenstein series and theta series.**

*Tuesday, June 25, 2019 4:00 PM (1 hour)*

Abstract:  $p$ -adic interpolations of Eisenstein series and theta series give explicit examples of  $p$ -adic families of automorphic forms. Their congruences with other automorphic forms help show lower bounds of certain Selmer groups. I will first explain the construction of a  $p$ -adic Klingen Eisenstein family for symplectic groups, and then discuss its connection with a  $p$ -adic family of theta lifts.
