Ryotaro SAKAMOTO. An application of the theory of higher rank Euler, Kolyvagin, and Stark systems.

Thursday, June 27, 2019 4:00 PM (1 hour)

Abstract: Recently, we established the theory of higher rank Euler, Kolyvagin, and Stark systems when a coefficient ring is Gorenstein. In this talk, I will discuss two applications of this theory. First, I will discuss equivariant BSD conjecture. Second, I will outline the construction of a higher rank Euler system for \mathbb{G}_m over a totally real field and explain that all higher Fitting ideals of a certain p -ramified Iwasawa module are described by analytic invariants canonically associated with Stickelberger elements. The first part is joint work with David Burns and Takamichi Sano.
