

Floer homology for singular lagrangians and homological mirror symmetry of \mathbb{CP}^n

mercredi 6 juillet 2022 11:00 (1 heure)

I will explain how to define a version of Floer homology for Lagrangians with conical singularities and how, in good situations, this construction leads to the definition of localised mirror functors which generalise those of Cho-Hong-Lau. Then I will apply this construction to find the mirror of the pair (\mathbb{CP}^n, D) where $D = \{x_0 = 0\} \cup \{x_1 \dots x_n = x_0^n\}$. This is a joint work in progress with Georgios Dimitroglou Rizell.
