Deep Neural Network for Audio and Music Transformations

vendredi 5 février 2021 15:30 (40 minutes)

We will first discuss how deep learning techniques can be used for audio signals. To that aim, we will recall some of the important characteristics of an audio signal and review some of the main deep learning architectures and concepts used in audio signal analysis. We will then illustrate some of these concepts in more details with two applications, namely informed singing voice source separation and music style transfer.
