

Trisections in colored tensor models

jeudi 19 janvier 2023 15:50 (30 minutes)

We give a procedure to construct trisections for closed 4-manifolds generated by colored tensor models without restrictions on the number of simplices in the triangulation, therefore generalizing previous works in the context of crystallizations and PL-manifolds. We give a description of how trisection diagrams can arise from colored tensor model graphs for closed 4-manifolds.
