

Francesca Pratali : Dendroidal ∞ -operads

Wednesday, July 5, 2023 9:45 AM (30 minutes)

The dendroidal formalism offers a powerful approach to defining operads as specific presheaves on a tree-based category. This combinatorial framework enables the definition of ∞ -operads, wherein composition is determined up to homotopy via presheaves that satisfy a weak dendroidal inner Kan condition. Notably, the homotopy theory of ∞ -operads has been shown to be equivalent, in both Quillen's sense and Lurie's ∞ -categorical sense, to the theories of topological and simplicial operads.

In this talk we will review these concepts and present some open questions in enriched settings.
