Eyring Kramers law and exit rates for the overdamped Langevin process

jeudi 17 novembre 2022 16:45 (45 minutes)

The kinetic Monte Carlo method (kMC) is widely used in practice to accelerate the sampling of the exit event from a metastable state in Molecular Dynamics. The so-called accelerated algorithms introduced by A.F. Voter and al. are based on the fact that the exit event is well aproximated by a kMC method parametrized by exit rates computed with the celebrated Eyring Kramers law. In this talk, I will justify rigorously this approximation.
