October, 2023

## The Nearest Neighbor Problem and application to cryptanalysis

- Boolean context
- Decoding random linear codes (DRLC) :

Find $x$ such that $H x=s$ with $|x| \leq w$ (NP-hard)

- Improve DRLC
$\Longrightarrow$ improve McEliece cryptosystem's cryptanalysis
- The best-known algorithms use in a crucial way a subroutine that solve NNP

## Nearest Neighbor Problem in $\mathbb{F}_{2}^{m}$

L
R

Goal: Find $C=(x, y) \in L \times R$ such that $|x+y| \leq \gamma m$

## Nearest Neighbor Problem in $\mathbb{F}_{2}^{m}$

L
R

| $\longleftrightarrow$ |  |  |  |  |  |  |  |$~ N=2^{\lambda m}$

Goal: Find $C=(x, y) \in L \times R$ such that $|x+y| \leq \gamma m$ Here $\gamma m=1 \Longrightarrow \gamma=\frac{1}{m}$

## The projection method

Probability that 2 bit strings we search coincide on $k$ columns: $\frac{\binom{m}{k}}{\binom{m(1-\gamma)}{k}}$

## The algorithm

- Pick k columns randomly
- Sort the 2 lists in lexicographic order according to the selected columns
- Compare all pairs of bit strings that coincide on the $k$ columns
- Repeat $\simeq \frac{\binom{m}{k}}{\binom{m(1-\gamma)}{k}}$ times

$$
k=2 \text {, drawn column numbers }=\{0,2\}
$$

## Complexity

$$
C_{\text {Proj }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{m}{k}}{\binom{m-l}{k}}\right)
$$

A well know complexity tradeoff is $k=\lambda m$ then

$$
C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)
$$

## Complexity

$$
C_{\text {Proj }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{m}{k}}{\binom{m-l}{k}}\right)
$$

A well know complexity tradeoff is $k=\lambda m$ then

$$
C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)
$$

where $h(\lambda, \gamma)=H(\lambda)-(1-\gamma) H\left(\frac{\lambda}{1-\gamma}\right)$

## In practice

## Parameters

$$
n=200, \gamma m=60, N \in[250,2300], \text { step }=10
$$

- $C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)$
- $C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)$
- $C_{M O}=\tilde{O}\left(2^{y(\lambda, \gamma) m}\right)$
- $C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)$
- $C_{M O}=\tilde{O}\left(2^{y(\lambda, \gamma) m}\right)$ where $y(\lambda, \gamma)=(1-\gamma)\left(1-\frac{H\left(H^{-1}(1-\lambda)-\gamma / 2\right)}{1-\gamma}\right)$
- $C_{\text {Proj }}=O\left(2^{m(\lambda+h(\lambda, \gamma))}\right)$
- $C_{M O}=\tilde{O}\left(2^{y(\lambda, \gamma) m}\right)$ where $y(\lambda, \gamma)=(1-\gamma)\left(1-\frac{H\left(H^{-1}(1-\lambda)-\gamma / 2\right)}{1-\gamma}\right)$
- With $\lambda=0.025$ and $\gamma=0.1 C_{M O} \geq C_{\text {Proj }} \Longrightarrow m \geq 256000 \Longrightarrow|L|=|R| \geq 2^{8000}$

At a fixed list size N and a fixed $\gamma$, what happens if the vectors are twice as long?

$$
2^{\lambda m}=2^{\frac{\lambda}{2} 2 m}
$$

Goal: Find $C=\left(x^{\prime}, y^{\prime}\right) \in L_{2} \times R_{2}$ such that $\left|x^{\prime}+y^{\prime}\right| \leq \gamma 2 m$

## Complexity

$$
C_{\text {Proj } 2}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{2 m}{k}}{\binom{2 m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Proj2 }}=O\left(2^{m\left(\lambda+2 h\left(\frac{\lambda}{2}, \gamma\right)\right)}\right) \text { with } 2 h(\lambda / 2, \gamma) \leq h(\lambda, \gamma)
$$

## Complexity

$$
C_{\text {Proj2 }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{2 m}{k}}{\binom{2 m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Proj2 }}=O\left(2^{m\left(\lambda+2 h\left(\frac{\lambda}{2}, \gamma\right)\right)}\right) \text { with } 2 h(\lambda / 2, \gamma) \leq h(\lambda, \gamma)
$$

And if we concatenate $L$ with itself, the same for $R$ ?

## Complexity

$$
C_{\text {Proj2 }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{2 m}{k}}{\binom{2 m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Proj2 }}=O\left(2^{m\left(\lambda+2 h\left(\frac{\lambda}{2}, \gamma\right)\right)}\right) \text { with } 2 h(\lambda / 2, \gamma) \leq h(\lambda, \gamma)
$$

And if we concatenate $L$ with itself, the same for $R$ ?
That won't work: some of the $k$ columns drawn can be identical

## Complexity

$$
C_{\text {Proj2 }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{2 m}{k}}{\binom{2 m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Proj2 }}=O\left(2^{m\left(\lambda+2 h\left(\frac{\lambda}{2}, \gamma\right)\right)}\right) \text { with } 2 h(\lambda / 2, \gamma) \leq h(\lambda, \gamma)
$$

And if we concatenate $L$ with itself, the same for $R$ ?
That won't work: some of the $k$ columns drawn can be identical
$\Longrightarrow$ Filtering on less than $k$ columns

## But let see the function $f(t)=t . h\left(\frac{\lambda}{t}, \gamma\right)$

## But let see the function $f(t)=t . h\left(\frac{\lambda}{t}, \gamma\right)$

In fact, $f(t)$ is decreasing

At a fixed list size N and a fixed $\gamma$, what happens if the vectors are $k$ times longer?

## Complexity

$$
C_{\text {Projk }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{k m}{k}}{\binom{k m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Projk }}=O\left(2^{m\left(\lambda+k \cdot h\left(\frac{\lambda}{k}, \gamma\right)\right)}\right)
$$

At a fixed list size N and a fixed $\gamma$, what happens if the vectors are $k$ times longer?

## Complexity

$$
C_{\text {Projk }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{k m}{k}}{\binom{k m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Projk }}=O\left(2^{m\left(\lambda+k \cdot h\left(\frac{\lambda}{k}, \gamma\right)\right)}\right)
$$

Concatenate $L$ with itself $k$ times, the same for $R$ ?

At a fixed list size N and a fixed $\gamma$, what happens if the vectors are $k$ times longer?

## Complexity

$$
C_{\text {Projk }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{k m}{k}}{\binom{k m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Projk }}=O\left(2^{m\left(\lambda+k \cdot h\left(\frac{\lambda}{k}, \gamma\right)\right)}\right)
$$

Concatenate $L$ with itself $k$ times, the same for $R$ ?
Again columns drawn can be identical

At a fixed list size N and a fixed $\gamma$, what happens if the vectors are $k$ times longer?

## Complexity

$$
C_{\text {Projk }}=O\left(\left(N+\frac{N^{2}}{2^{k}}\right) \frac{\binom{k m}{k}}{\binom{k m(1-\gamma)}{k}}\right)
$$

If we choose $k=\lambda m$ then

$$
C_{\text {Projk }}=O\left(2^{m\left(\lambda+k \cdot h\left(\frac{\lambda}{k}, \gamma\right)\right)}\right)
$$

Concatenate $L$ with itself $k$ times, the same for $R$ ?
Again columns drawn can be identical It looks like drawing with replacement

The projection method drawing columns with replacement

## Complexity

$$
C_{\text {ProjR }}=O\left(\left(N+\frac{N^{2}}{2^{m\left(1-\left(1-\frac{1}{m}\right)^{k}\right)}}\right)(1-\gamma)^{-k}\right)
$$

The projection method drawing columns with replacement

## Complexity

$$
C_{\text {ProjR }}=O\left(\left(N+\frac{N^{2}}{2^{m\left(1-\left(1-\frac{1}{m}\right)^{k}\right)}}\right)(1-\gamma)^{-k}\right)
$$

If we choose $k=\frac{\ln (1-\lambda)}{\ln \left(1-\frac{1}{m}\right)}$ then

The projection method drawing columns with replacement

## Complexity

$$
C_{\text {ProjR }}=O\left(\left(N+\frac{N^{2}}{2^{m\left(1-\left(1-\frac{1}{m}\right)^{k}\right)}}\right)(1-\gamma)^{-k}\right)
$$

If we choose $k=\frac{\ln (1-\lambda)}{\ln \left(1-\frac{1}{m}\right)}$ then

$$
C_{\text {ProjR }}=O\left(N(1-\gamma)^{-k}\right)=O\left(2^{m\left(\lambda+\log _{2}(1-\gamma) \ln (1-\lambda)\right)}\right)
$$

The projection method drawing columns with replacement

## Complexity

$$
C_{\text {ProjR }}=O\left(\left(N+\frac{N^{2}}{2^{m\left(1-\left(1-\frac{1}{m}\right)^{k}\right)}}\right)(1-\gamma)^{-k}\right)
$$

If we choose $k=\frac{\ln (1-\lambda)}{\ln \left(1-\frac{1}{m}\right)}$ then

$$
C_{\text {ProjR }}=O\left(N(1-\gamma)^{-k}\right)=O\left(2^{m\left(\lambda+\log _{2}(1-\gamma) \ln (1-\lambda)\right)}\right)
$$

$$
\log _{2}(1-\gamma) \ln (1-\lambda) \leq h(\lambda, \gamma)
$$

Work in progress:

- Drawing columns with replacement in practice ?
- Concatenate lists seems to improve complexity of Esser, Kübler and Zweydinger algorithm

$$
2 y(\lambda / 2, \gamma) \leq y(\lambda, \gamma)
$$

## Thank you
