

Mini-cours : Dynamical degrees of birational transformations of surfaces

The dynamical degree $\lambda(f)$ of a birational transformation f of a surface measures the exponential growth of the formula that define the iterates of f . It allows to study the complexity of the dynamic of f . For instance, over the field of complex number, the number $\log(\lambda(f))$ gives a upper bound for the topological entropy. The number $\lambda(f)$ is an algebraic integer of a special kind: a Pisot or Salem number. Its value gives informations on the transformation, for instance on the fact that it is conjugate or not to an automorphism of a projective surface. More generally, I will try to explain in this mini-course how a precise information on the dynamical degree allows to understand the geometry of the transformation, for instance its conjugacy class or its centraliser in the group of all birational transformations.
