The Klein—Gordon equation on asymptotically flat spacetimes

vendredi 12 avril 2024 14:30 (55 minutes)

We consider the Klein—Gordon equation on Minkowski space with a potential that decays suitably fast in spatial directions and approaches a limiting potential as t tends to infinity. The aim of this talk is to describe a global construction of the Feynman inverse for this problem. This is joint work with Moritz Doll and Jesse Gell-Redman (Melbourne).

Orateur: BASKIN, Dean (Texas A&M University)
