Davenport and Gao constants for a weighted zero-sum problem with quadratic residues

François Hennecart (Institut Camille Jordan Lyon St-Étienne)

Colloque Additive Combinatorics in Bordeaux Université de Bordeaux 11-15 avril 2016

1 / 16

▲□▶ ▲□▶ ▲ □▶ ▲ □ ▶ ▲ □ ● の < @

Definitions

Let $R, +, \cdot$ be a finite ring and $A \subset R \setminus \{0\}$.

► Weighted Davenport constant D_A(R): least integer such that any sequence S of R with length ||S|| ≥ D_A(R) has a (non empty) subsequence g₁ • g₂ • · · · · g_ℓ such that

$$0 \in \sum_{i=1}^{\ell} Ag_i \subset \Sigma_A^{(\ell)}(S) := \{A \text{-weighted sums of } \ell \text{ terms of } S\}.$$

$$0 \in \sum_{i=1}^{\ell} Ag_i \subset \Sigma_A^{(\ell)}(S) := \{A ext{-weighted sums of } \ell ext{ terms of } S\}.$$

Weighted Gao constant E_A(R): least integer such that any sequence of R with length E_A(R) has a subsequence g₁ • g₂ • · · · • g_{|R|} such that

$$0 \in \sum_{i=1}^{|R|} Ag_i$$

Notation: for a sequence S of R we denote Σ_A(S) all (non empty) A-weighted sums of terms of S. Hence

 $D_{\mathcal{A}}(R) := \min \left\{ k \ge 1 \text{ such that } \|S\| \ge k \Rightarrow 0 \in \Sigma_{\mathcal{A}}(S) \right\}.$ (ACB 2016) 2 / 16

► Remark 1: D_A(G) and E_A(G) can be defined when G, + is a finite group and A ⊂ Z \ {0}.

- ► Remark 1: D_A(G) and E_A(G) can be defined when G, + is a finite group and A ⊂ Z \ {0}.
- Remark 2: the case A = {1} (or any invertible element of R) refers to the classical Davenport and Gao constants, simply denoted by D(G) and E(G).

- Gao Theorem (1995): let G, + be an abelian group. Then E(G) = D(G) + |G| 1.
- Grynkiewicz-Marchan-Ordaz Theorem (2012): $E_A(R) = D_A(R) + |R| - 1.$

The case $R = \mathbf{Z}/n\mathbf{Z}$ is known since Yuan and Zeng (2010).

Examples

Denote for simplicity $Q^* = Q_n^*$ the set of invertible squares in a given fixed ring R.

► $D(\mathbf{Z}/n\mathbf{Z}) = n$ (Erdős-Ginzburg-Ziv).

Examples

Denote for simplicity $Q^* = Q_n^*$ the set of invertible squares in a given fixed ring R.

- ► $D(\mathbf{Z}/n\mathbf{Z}) = n$ (Erdős-Ginzburg-Ziv).
- D_{Q*}(Z/pZ) = 3 if p ≥ 7 is prime.
 Proof. We have |Q*| = (p − 1)/2. Then by the Cauchy-Davenport Theorem

$$|Q^*a + Q^*b + Q^*c| \ge \min(p, 3(p-1)/2 - 2) = p$$

if a, b, c are not 0. Otherwise we plainly have $0 \in Q^* a \cup Q^* b \cup Q^* c$. Conversely take x be a nonsquare modulo p. Then $0 \notin Q^* \cup -Q^* x \cup (Q^* - Q^* x)$.

- Theorem (Chintamani-Moriya, 2012): if gcd(n, 30) = 1 then $D_{Q^*}(\mathbf{Z}/n\mathbf{Z}) = 2\Omega(n) + 1$.
- The proof uses an inductive argument and an addition theorem:
- Chowla Theorem: if $X \subset \mathbb{Z}/n\mathbb{Z}$ and $Y \subset (\mathbb{Z}/n\mathbb{Z})^{\times}$ then

 $|X + Y| \ge \min(n, |X| + |Y| - 1).$

Idea of the proof (upper bound)

Let S be a sequence of length $||S|| = 2\Omega(n) + 1$.

First case: if for some $p \mid n, S$ has at most two terms non divisible by p then one applies the induction hypothesis to $S' := \frac{1}{p} \times \tilde{S}$ where \tilde{S} is the subsequence of S formed by the terms divisible by p: S' can be viewed has a sequence of $\mathbf{Z}/m\mathbf{Z}$ where m = n/p with length $\geq 2\Omega(n) + 1 - 2 = 2\Omega(m) + 1.$

7 / 16

Idea of the proof (upper bound)

Let S be a sequence of length $||S|| = 2\Omega(n) + 1$.

- First case: if for some $p \mid n, S$ has at most two terms non divisible by p then one applies the induction hypothesis to $S' := \frac{1}{p} \times \tilde{S}$ where \tilde{S} is the subsequence of S formed by the terms divisible by p: S' can be viewed has a sequence of $\mathbf{Z}/m\mathbf{Z}$ where m = n/p with length $\geq 2\Omega(n) + 1 - 2 = 2\Omega(m) + 1$.
- Second case: for each $p \mid n, S$ has at least 3 terms coprime to p. There are $p^k(p-1)/2$ square units modulo p^k . Hence if $p \nmid abc$, by Chowla Theorem $\left| Q_{p^k}^* a + Q_{p^k}^* b + Q_{p^k}^* c \right| = p^k$, that is

$$Q_{p^k}^*a + Q_{p^k}^*b + Q_{p^k}^*c = \mathbf{Z}/p^k\mathbf{Z}.$$

By the Chinese remainder Theorem, taking the minimal subsequence $s_1 \cdot \cdots \cdot s_\ell$ of S containing 3 terms coprime to p for each $p \mid n$, one has

$$\sum_{i=1}^{\ell} Q_n^* s_i = \mathbf{Z}/n\mathbf{Z} \quad \text{hence} \quad 0 \in \sum_{i=1}^{\ell} Q_n^* s_i.$$
