

## Research Talk (online): Resurgence and quantum modularity

*vendredi 9 juin 2023 16:45 (1 heure)*

Improved analytic properties of solutions to certain  $q$ -difference equations have given the ability to compute conjectural formulae for Stokes constants of associated asymptotic series. This was first explored for some invariants associated to simple knots by Garoufalidis-Gu-Mariño. I will explore examples from the perspective of quantum modular forms involving work of the previous authors and additionally work of Kashaev and Zagier.
